WHAT IS CLAIMED IS:

1. An image processing apparatus which processes image data, comprising:

a connector, arranged to connect said image processing apparatus to a network to which plural client terminals are connectable;

an acceptor, arranged to accept a request from one of the plural client terminals connected via said connector;

a processor, arranged to perform a process regarding the image data in accordance with the request accepted by said acceptor;

a registering unit, arranged to register the content of the process performed by said processor;

a discriminator, arranged to discriminate, when the request is accepted by said acceptor, whether or not the content of the process according to the request has been registered in said registering unit; and

a determinator, arranged to determine the content of the process by said processor when the request is accepted by said acceptor in accordance with a discrimination request by said discriminator.

2. An apparatus according to Claim 1, wherein said determinator determines a format of data to create a screen to be displayed on the client terminal in accordance with the request accepted by said acceptor.

3. An apparatus according to Claim 2, wherein the screen is to display information regarding the image data for the client terminal which sent the request accepted by said acceptor.

5

4. An apparatus according to Claim 2, wherein the screen is to select a destination necessary to transmit the image data.

10   5. An apparatus according to Claim 1, further comprising a sending unit, arranged to send the registered content to the client terminal which sent the request, when the content of the process is registered by said registering unit.

15

6. An apparatus according to Claim 1, wherein said processor generates a Web page according to the request accepted by said acceptor.

20   7. An apparatus according to Claim 1, further comprising an outputter, arranged to output the image data,

wherein said determinator limits a function regarding said outputter in accordance with the client

25   terminal which sent the request accepted by said acceptor.

8.   An apparatus according to Claim 7, wherein said outputter prints an image on a recording sheet on the basis of the image data, and said determinator limits the number of faces of the recording sheet to

5   which the printing by said outputter is permitted discriminatingly for each client terminal.

9.   A control method of an image processing apparatus which processes image data, said method

10   comprising:

an accepting step of accepting a request from one of plural client terminals connected to the image processing apparatus via a network;

a processing step of performing a process

15   regarding the image data in accordance with the request accepted in said accepting step;

a registering step of registering the content of the process performed in said processing step;

a discriminating step of discriminating, when the

20   request is accepted in said accepting step, whether or not the content of the process according to the request has been registered in a registering unit in said registering step; and

a determining step of determining the content of

25   the process in said processing step when the request was accepted in said accepting step in accordance with a discrimination request of said discriminating step.

10. A computer readable program, stored in a storage medium, for controlling an image processing apparatus which processes image data, wherein said program executes a control method comprising:

5   an accepting step of accepting a request from one of plural client terminals connected to the image processing apparatus via a network;

a processing step of performing a process regarding the image data in accordance with the request

10   accepted in said accepting step;

a registering step of registering the content of the process performed in said processing step;

a discriminating step of discriminating, when the request is accepted in said accepting step, whether or

15   not the content of the process according to the request has been registered in a registering unit in said registering step; and

a determining step of determining the content of the process in said processing step when the request

20   was accepted in said accepting step in accordance with a discrimination request of said discriminating step.
